12 THEMES FOR CLIMATE, JOBS, SECURITY, QUALITY OF LIFE AND HEALTH

For people with disabilities

1-Everyone's accessibility to everything:

It remains an essential issue for our society.

Accessibility is everyone's business. 12 million French people with disabilities are affected (all age groups combined). In addition, the same applies to seniors, sick or injured people, women at the end of pregnancy, families with strollers, etc.

In a position to be ratified by parliament, a part will be repealed by the Council of State . The decree of

08/12/2014 provided elements for bringing ERP¹ and IOP² into compliance.

The reasons given: since access to the ERP¹ does not allow a PMR³ to cross it in a wheelchair, the cancellation applies to older establishments.

This law should have been applied on January 1, 2015 under the presidency of François Hollande. It was not

sufficiently followed up with effects.

Simplify daily life by building a society more open to people with disabilities.

Proposals:

- Validate the decrees suspended since January 1, 2015.
- Constrain ERP¹ (administrations, communities (roads), businesses, places of culture, sports areas, leisure areas, places of outdoor tourist accommodation, hotels, public transport etc.) to comply with law no. 2005 of February 11, 2005.
- Apply significant sanctions and penalties to all ERP¹ not respecting the law on public accessibility to MR⁴ for 3.5 million people (5.3% of the population) including 650,000 in wheelchairs, blindness for 1.7 million, hearing loss for 4 million French people.
- Remove from the DDTM⁵ the heavy burden of having the power of control which remains ineffective because of its multiple actions.
- Enforce construction standards in collective housing in the context of new housing for PMR³ in order to better take into account their needs. A PMR³ must be given priority for the allocation of collective housing within the framework of compliance with Law No. 2005. Any failure by the builder or lessor must be sanctioned by penalties and a formal notice for non-compliance. compliance with the law in force.

Create a "Citizenship & Disability" ministry to manage all actions relating to the well-being of people with disabilities.

¹Establishments Open to the Public, ²Facilities Open to the Public, ³Person with Reduced Mobility, ⁴Reduced Mobility, ⁵

Departmental Directorate of Territories and the Sea.

2-Discrimination:

Before disappearing in 2010, the HALDE⁶ noted in its annual report that the criterion of state of health and

disability was ranked 2nd (19%) in the context of discrimination. With 27%, discrimination based on origins came first.

According to the annual activity report established by the DDD⁷ in 2020, we note access weakened by the

health crisis (COVID-19 pandemic) for the most vulnerable people, in particular people with disabilities with 21.2% (in 2019, 22.7%). Today, the situation of disability ranks first among the grounds for discrimination. In 2nd position comes origins with 13.3%.

For the 4th consecutive year, disability remains the leading cause of discrimination.

a) Disabled Workers:

The rate of job seekers among TH⁸ according to the 2020 AGEFIPH⁹ annual report was 8.2% of job seekers.

- 493,156 were registered in all categories (A, B, C) at the employment center.
- 61% of DEBOE¹⁰ are long-term unemployed.
- 27,718 TH⁸ were recruited.
- 8,933 were kept in their jobs.

Proposals:

- The OETH¹¹ must be imposed in all companies regardless of the total number of employees (the current quota for establishments with at least 20 employees is at least 6%). It must also be imposed on all public service departments whatever the nature and working conditions with compulsory job adjustment.
- Provide for more significant financial sanctions for non-compliance with the OETH¹¹.
- Show total transparency on the funds collected in relation to this breach.
- Really transfer these funds into the professional retraining of these TH⁸ and provide concrete assistance for the inclusion of PWD¹².
- Stop this systemic discrimination of part-time employment contracts.
- For equal skills and experience, put salaries at the same level (the same applies to male and female employees).
- The employment rate has stagnated since 2018. Mandate a permanent contract¹³ for TH⁸ and increase the OETH rate¹¹ which is only 3.5% of the workforce.

b) Holders of the CMI¹⁴:

Without being in consolidation, holders of this card are recognized with at least an 80% disability rate. The parking space must be respected with a dimension of 5mx3.3 m at least. It must represent a total of 2% of the park (law no. 2005).

High Authority for the Fight against Discrimination and Equality, ⁷ Defender of Rights, ⁸ Disabled Workers, ⁹ Association for the Management of Funds for the Professional Integration of Disabled People, ¹⁰ Job Seekers Beneficiaries of the Employment Obligation, ¹¹ Obligation to 'Employment of Disabled Workers, ¹² People with Disabilities, ¹³ Permanent-Term Contract.

Proposals:

- Stop studying files for obtaining convenience cards.
- Heavily sanction false holders as well as people using this right in a personal capacity and not as an accompanying person.

- Review the making of this card. Provide a QRC system so that it can be identified by a scan when there is doubt.
- That community policing can intervene not only in public parking but also in collective and private parking lots.
- Transparency on funds collected for illegal parking.

c) Inclusion of children in schools & support for AESH¹⁵ (ex-AVS¹⁶):

The State's obligation to educate children and adolescents (from 3 to 16 years old) is a duty for all parents. They can send them to school themselves with follow-up. For national education, it must be an essential and absolute right to educate young people with disabilities in an ordinary environment. Attendance should not be a barrier for these young people who only ask to be considered without any particular distinction.

Law No. 2005 of February 11, 2005 reaffirms this in article L-112-1. It specifies that “any child, any adolescent who has a disability or a disabling health condition is enrolled in the school or one of the establishments closest to their home (reference establishment, school card).

Let us use this case law to move in the right direction.

Proposals:

- For National Education to apply the law on accessibility to all establishments built before 2005. Provide the same penalties (in complete transparency) as in the private sector.
- Oblige heads of establishments to accept children with disabilities who are within the framework of the reference establishment. Sanction non-compliance as in the professional context (OETH¹¹).
- Impose a quota as in the private sector based on the total number of students in each establishment (on the same principle as for employers). Provide significant penalties for establishments (public & private) that do not comply with the law.

Reorganize the MDPH¹⁷, stop the administrative mille-feuille, the duplication.

- Stop renewing the request (every year) when the child has no change in his health situation. That the child is not out of school while waiting for a response or waiting for a carer.

¹⁴Inclusive Mobility Card (ex-GIC), ¹⁵Accompanying Students with Disabilities, ¹⁶School Life Assistant.

¹⁷Departmental House for Disabled People, ¹⁸Cpmmission for the Rights and Autonomy of Disabled People.

IV) The MDPH¹⁷:

Its objective is to develop the life project of each person with a disability. Her role is to support them and inform their loved ones. It also raises citizen awareness of disability. A multidisciplinary team (doctors, social workers, occupational therapists, nurses, educators, psychologists) assesses the

applicant's needs. The time taken to study a file (depending on each case) is 5.5 months on average when passing through CDAPH¹⁸. 104 establishments are spread across the national territory.

Processing a file within the MDPH¹⁷:

- ☒ Reception of the file at reception: we check the documents attached to the request. When the file is admissible, a file number is opened which is transmitted to the applicant.
- ☒ This file is sent to the multidisciplinary team which does not necessarily sit at the MDPH¹⁷.
- ☒ After studying the request, the documents are sent to the CDAPH¹⁸. It meets once a week for adults and once a month for children. She decides whether or not to grant the requests made. This commission is made up of 1/3 of its members representatives of disabled people, representatives of parents, the State, the department, the CAF and the CPAM.

The MDPH¹⁷ only presents the file to the commission which decides by a vote.

- ☒ At the end of the decision and within one month, it sends a notification of decision.
- ☒ If the decision is negative, the applicant has one month to appeal.

Proposals:

The slowness of studying files does not reduce inequalities which are more or less significant depending on the territory.

- Reorganize all MDPH¹⁷ services.
- The dematerialization of files does not make the study of these requests any faster.
- Stop the “administrative mille-feuille.”

The processing time for a particular file is on average 2.5 months to more than a year.

- Opt for “the single number” with the crossing of files between the different organizations (MDPH, CAF, CPAM etc.).

Agriculture, key and foundation of everything

The natural order of things is that agriculture and ecology are accomplices, fraternal, united. This is not yet the case because of the faults of EELV, while the common good requires this union. What interests centrist ecologists is not “whose fault is it?” , but to resolve, to provide solutions.

Let's analyze.

Today, we need all professions for the common good, but two of them have a very particular weight: the policeman and the farmer.

The first risks his life every day for us, the second allows us to eat.

This is why it is pure madness to include agriculture in free trade.

Agricultural activity teaches us realism and moderation. "Everything is poison, nothing is poison" said Paul Valery, here we are: in the ideal world, farmers and ecologists would want 0 synthetic chemicals, whether we are talking about fertilizers or pesticides. It is possible if the population accepts much less abundance in food shelves, price increases of 10 to 100% and many young people choose a difficult agricultural activity: from an environmental and health point of view, weeding by hand is the healthiest. But we easily understand that these options are very complicated. Farmers are 100% in agreement to do without synthetic chemistry, but either a replacement molecule is needed or higher unit prices for lower or zero production in certain cases. Therefore, we must gradually reduce synthetic chemistry in agriculture but doing without it completely, all the time and everywhere, is not realistic. Obviously, we respect and appreciate the 100,000 producers and processors who work in organic farming in France and the organic farming operations which represent 13% of agricultural operations and nearly 10% of the surface area. Supporting them is a priority.

In the book "The 4 solutions to the Crisis" (2012), Jean Marc Governatori explained his desire for rural France. If there were 2.5 million farmers in France in 1955, there are less than 500,000 today. As there are 22 million people living in rural areas, a third of our population, farmers are a very small minority in our territories. But like rural people, they suffer from lack of public services, medical deserts, complicated transport...

Specialists point out that changes in political regimes, and even changes in civilization, are often caused by an agricultural crisis. That without famine, there might not have been a revolution in 1789 in France. That the migration problem is fueled by dormant subsistence agriculture in the countries left. That without quality food, there is no lasting health. That without peaceful farmers, the future is dark. That without peasants, it is the end of everything.

The key points linked to agriculture, they all need to be addressed, are: the attractiveness of the profession, the administrative burden, the transfer of farms, the unfair competition suffered, the environmental impact, the health impact, the use of science, peasant income and the food autonomy of our territories.

There are different sources on agricultural figures. According to INSEE, in 2019, farmer-operators represented only 1.5% of the country's total employment, a proportion divided by more than 4 in 40 years. According to Statista data, the number of agricultural farms in mainland France fell from 1,587,600 in 1970 to 390,000 in 2020, a decrease of around 75%. At their head, there are barely 500,000 operators and co-operators left... That's for the quantity aspect, but there is the "morale of the troops" aspect, and there it is also worrying: the conditions of precarious living, health problems linked to activity, painful criticism, increased and unfair competition from outside countries, regulations, economic difficulties, weather hazards, the climate crisis, income instability and loneliness, cause the suicide rate among farmers to be at its highest: every day in France, a farmer commits suicide.

It is easy to understand why they are protesting and they were right to do so. The peaceful and intelligent mass demonstration is a good way to advance the common good.

It is one of the professions where income is the most disparate, even if the average annual income would be €30,000 for agricultural employees, €23,000 for farmers for 55 hours of work on average per week! With his income, the farmer must live and invest and as this is insufficient, he borrows and consequently he is in debt. At the same time, 1/4 of farmers survive below the poverty line according to INSEE in a 2022 report. If we examine the income of farmers only, and not of agricultural employees, fruit and vegetable producers, or winegrowers, receive on average €2,800 per month. Cattle breeders earn on average €1,500 and sheep or goat breeders less than €700... Farmers receive direct payments from European agricultural funds but this does not compensate for the difficulties of the profession. Winegrowers are generally those who generate the most income while pig, cattle and sheep breeders have more financial difficulties. This is why a planned and organized end to industrial breeding is necessary, also taking into account its environmental impact and animal suffering. Brittany, and its green algae, is the region that suffers the most from industrial farming. In France, agriculture emits 20% of greenhouse gases and practically all of ammonia emissions according to ADEME. This sector emits half of total suspended dust emissions, which contributes to air pollution. All of this obviously attacks the health of the farmer and agricultural workers. Distributing livestock farming across the entire territory with a link to the land and not above ground is a step forward.

If our trade balance is still in surplus, France has gone from 2nd to 5th place among world exporters.

We understand why one in ten farmers say they are optimistic and half are pessimistic. Hence the concern of political decision-makers about the non-renewal of all these farmers who will be of retirement age, this concerns almost half of the farmers by 2030. The EGalim laws have not resolved everything and they are poorly respected. Organic farmers seem to have better morale but the drop in consumption and the importation of products of sometimes dubious quality still represent a problem.

All this is surprising: what do political decision-makers do?

The enlightened politician has therefore understood that insistently conveying the message which explains that stopping futile spending (buying designer clothing, ultra-processed sugary products or changing your cell phone early) in order to be able to pay for your food at the right price, is a vital decision. And 10 million tonnes of food waste in France each year is very messy at a time when many of our farmers are not getting by. The consumer cooperative "Who's the Boss?!" » is an excellent initiative to help French agriculture.

We must also put in place an ambitious program for the development of agroecology and soil conservation agriculture which is based on three founding principles: minimum tillage (even going as far as the absence of tillage). soil), crop rotations and associations, and soil coverage after harvest with a living plant cover for several months. The international "Four per thousand" initiative aims to implement these concrete actions to increase the quantities of carbon stored in the soil. In this matter, the overseas territories play an important role despite their small surface area (15% of that of France): they are equivalent to 20% of the carbon stocks of the Metropolis. This is mainly explained by the original mineralogy of these soils developed on volcanic rock. Coordinated by CIRAD in partnership with INRAE and IRD, the "Quatre pour mille" study confirms this particularity for overseas territories.

Agriculture with better quality products rather than agriculture obsessed with quantity will be better for farmers, for all the companies that work for it, for consumers and for the image of our country which must become synonymous with quality in all areas. Standards mean health safety for everyone.

The potability of water is based on 70 criteria, these are the standards specific to the tap water that we can drink. Who would like to delete it? On January 30, 2024, there was a fatal fire in a building in Marseille with the death of a child due to squatters and non-compliance with safety standards... The maritime disasters of the Amoco Cadiz, Erika or Prestige were caused by absent or non-respected standards. Agree that of the 400,000 standards in our country across all sectors, we can certainly do a little cleaning up, but engaging in demagoguery on this subject is criminal. Environmental and health standards are essential, but obviously, we don't put regulated agriculture in competition with agriculture whose only rules are productivity and low prices, that's totally stupid! The mirror clause is necessary in all commerce and particularly in the agricultural sector. Single market, single rules, right? A 10 year old child understands this. Our policies force our farmers to face competition from products from the European Union itself, which sometimes have less strict phytosanitary programs. Is there a pilot on the plane ?

Agriculture is therefore incompatible with this free trade.

Retorting that our agricultural surplus of around ten billion could suffer does not stand up to analysis: this is not necessarily true because quality sells, and on the other hand, it is the price of our food sovereignty , our health and a sustainable environment. I know very well that too often the agricultural point is a variable of adjustments in free trade treaties but we are in such a deficit in overall foreign trade that on the one hand, we therefore have a lot of negotiating weight, which on the other hand, we do not trifle with health and the environment and finally the image of quality is a real competitive advantage. The free trade agreement with New Zealand is indeed a bad idea and although I have empathy for the suffering of the Ukrainians, buying chickens from them to the detriment of our producers is wrong. It must be known that anyone who eats imported meat often eats GMOs and antibiotics. We cannot impose health rules on our farmers and put imported sick products on our

markets. Same subject on cherry where Rhone producers are dying because they have rightly been banned from a product harmful to health, but our political decision-makers accept Turkish cherries stuffed with synthetic chemicals!

This is why it is essential that food labeling is clear and visible so that consumers can take responsibility. The peasant's work is paid for.

- There is a need for a European standard for imported food products.
 - Apply the Egalim laws which help to free our farmers from the clutches of the agro-industrial system denounced by Hervé Kempf and Nicolas Legendre.
 - Instead of taxing farmers' non-road fuel, let's make them use an agrofuel without emissions but also without taxes: agriculture is sacred.
 - There are 500,000 unemployed secretaries in France, let's create an organization that allows farmers to have an administrative service per territory which frees them from excess paperwork.
 - Programming the transition from industrial farming is an absolute necessity, meat will be more expensive, but the French will eat less and be better off. The consumer also has a responsibility here: the hunt for low prices destroys our agriculture, environmental health and human health.
 - We import half of our fruit and vegetables, but it is the most profitable agricultural profession, so let's increase its share (on average, we import a quarter of our food supply).
 - We can also better direct European aid towards agroecology.
 - Support the massive development of plant cover on soils in winter because it promotes soil life, water infiltration and carbon capture.
 - Identify abandoned land.
 - The State must provide the capital to allow young people to settle down, as is the case in the Netherlands.
 - Additional support for organic financed by a tax on ultra-processed products.
 - in terms of agroforestry: replanting hedges, maintaining permanent natural meadows, developing trees in fields
- (specific program of the region, Agri-environmental and Climate Measures (MAEC), targeted investment aid),
- develop alternatives to synthetic fertilization: cultivation of legumes, composting platforms, etc. (training, financing of collective projects, promotion of initiatives, MAEC, targeted investment aid),

- Act so that each region has its own seed reserve (we store some) and preserve free seeds, two of the obligatory conditions of our sustainable food sovereignty.
- Develop a 100% compost objective by recovering 100% of organic waste to aim for autonomy for fertilizers and maximum reduction of synthetic nitrogen fertilizers.
- develop organic agriculture: set up non-area territorial Payments for Environmental Services (PES), support organic installations and transmissions. and soil conservation agriculture

Engaging protein mutation through legume production and nutritional education:

- to show a very clear orientation of the Operational Program of the European Agricultural Fund for Rural Development (EAFRD) towards aid coupled with legumes and fruits and vegetables and aid for sustainable livestock farming (pasture farmers, origin of food, etc.),
- Increase the number of educational farms of the Savoir Vert type.

Offering sustainable food in public catering:

- Implementation of a daily vegetarian option.
- 50% of products that are both organic and local within 5 years.
- Stopping support for large useless and ruinous projects such as land artificialization.
- Preservation of agricultural land around metropolises.
- Freeze land urbanization.
- Greening cities by increasing the number of trees and community vegetable gardens, in conjunction with the residents, associations and elected officials concerned. Vegetable gardening in our cities is essential for the food and climate security of urban populations.

Banning all imports of agricultural products with less demanding environmental and health constraints than those imposed on our farmers is the basis of the base.

Agricultural activity is broader than producing foodstuffs: it participates in the life of the territories, it is potentially a major recruiter (no unemployment 60 years ago thanks to this activity), it is educational for our youth, it produces energy and generator of living conditions. There are less than

500,000 farmers in France, more than 55 million adults reside in our country: if each adult on average agreed to spend 50€ more per year on their French food, this would represent an annual windfall of nearly 3 Billions of Euro's. Eating green and French isn't that much more expensive after all.

The bill aimed at strengthening the balance in commercial relations between suppliers and distributors known as "Egalim 3" was definitively adopted on March 22, 2023.

The text initially provoked an outcry from major retailers, with distributors arguing in particular that certain measures of this law would have an inflationary effect, in the midst of a period of rising prices.

After passing through a joint committee, and despite strong opposition to this text, the law was finally adopted and completes the provisions of the Egalim 1 and 2 laws.

Among its key measures, the text provides in particular:

- on an experimental basis for 3 years, in the event of the absence of a contract signed between supplier and distributor before March 1, the supplier will have the choice of interrupting deliveries if the selling price of its products is considered too high. low, or to opt for the application of a classic termination notice which must take into account "the economic conditions of the market on which the parties operate", if necessary by contacting the mediator of agricultural or business commercial relations in order to set the conditions of the notice,
- the extension of the resale system at a loss increased by 10% (SRP +10%) until April 15, 2025 except for fresh fruit and vegetables,
- the extension of the supervision of promotions until April 15, 2026 on food products in supermarkets at 34% of their value and 25% of their volume, as well as its expansion, from March 1, 2024, to all consumer products,
- the application of French law to contracts negotiated between suppliers and purchasing centers based abroad when the products are sold in France,
- the capping of logistics penalties at 2% of the value of the products ordered falling within the product category within which the contractual non-performance was noted,
- or the modification of option no. 3 of presentation of the share of the primary agricultural method of the supplier's price, by involving the independent third party upstream of the negotiations (which will certify the share represented by the evolution of the price agricultural raw materials in the evolution of the supplier's tariff) and downstream (which will attest to the absence of negotiation on the share of the tariff evolution resulting from the evolution of the price of agricultural raw materials).

Democracy

Democracy is proof of the responsibility and maturity of the citizen and of a human community. Their decisions to vote or not, to vote out of habit or out of anger, to vote after reflection or impulsively, to obtain information or not, to put pressure on elected officials or not, to get involved in politics or not, to intervene or not in the media, to engage or not in associations, unions, affirm democracy or not. But in the same way, politics has its part to do in establishing a democracy. Here are the necessary measures:

- Get away from presidentialism by setting up a first-ministerial triumvirate. These three Prime Ministers will be elected by the National Assembly, the Senate and a new Assembly of 200 volunteer citizens drawn by lot.
- Give legal value to the blank vote
- Make the popular initiative referendum accessible
- Introduce a dose of proportionality in the legislative elections
- Introduce a possibility of recall at mid-term for all elected officials
- Refuse parliamentarians to combine their mandate with an executive local, but also to accumulate more than 2 successive mandates
- Prohibit the re-election of deputies of the majority party when certain criteria (unemployment, public health, security, etc.) have deteriorated at the end of the mandate. Same in case of conviction

- Preserve public services everywhere
- Carry out a comparative study of the impact of agricultural, banking, prison, educational, tax, health, social policies... with other countries to get the best out of it and apply it
- Solve the problem of immigration at the European level by ceasing to sabotage agriculture in poor countries, and by the evolution of aid towards micro-projects, with microcredits in emigration countries so that the natives feel good there.
- Cooperate with local actors in these countries
- Act for the diversity and independence of the media through unconditional and clear constitutional financial support.

- Put an end to the appointments of those responsible for public broadcasting by the President of the Republic

- Make it easier to obtain legal aid
- Increase the number of social educators and sports instructors
- Regularize undocumented immigrants holding a fixed job for at least 3 months, with a fine for employers
- Examine with committees of independent experts all alternatives in all areas (free energy, water,

compressed air or very low oil consumption engines, etc.) but also nuclear power, medicines, vaccines, waves linked to mobile phones, low consumption lamps, land spreading, suspicious traces in the sky, the advantages and disadvantages of timetable changes...

- Prohibit any conflict of interest in expert committees
- Creation of a dynamic of scientific and industrial collaborations between public research laboratories (CNRS, INSERM, INRA, etc.), industrial companies and independent innovators
- Examine by Specialized committees comprising specialists and people concerned, the impact and action of banks, insurance companies, co-ownership trustees and the use of public funds
- Supervise lobbying at all levels of public decision-making

Waste

In an advanced country, waste is rare and when it exists, it is a raw material.

Promote and financially support local projects enabling waste prevention (local composting, bulk sales, reuse, deposit and other circular economy approaches):

- direct specific budgets (human resources) to lead this circular economy approach at the local level and facilitate the installation or launch of these projects,
- launch calls for dedicated projects (financial support),
- raise awareness among all regional stakeholders of this issue and encourage synergies to support projects (especially from local authorities).
- develop Local Exchange Systems everywhere which allow the exchange of goods, skills and time

Economy

Europe was built on the basis of the single market and with its consumers. But it has abandoned its companies facing unfair competition within and outside the European Union. Free trade has failed again.

The choice of this liberal globalization without rules has not only shaken Europe but by too often accepting social and environmental dumping, it has caused great harm to our businesses.

- Make it known that circular economy + energy renovation + renewable energies + peasant farms = Full employment

- relocate by supporting the redeployment of a local economic and agricultural fabric which will reduce imports of products and raw materials as well as food dependence in each region.
- Support and structure the sectors of the future in the ecological transition to create quality jobs that cannot be relocated.
- help with capital and loans to companies that meet our objectives of recycling 100% of the products used in each region at the end of the mandate, such as its food autonomy and its energy autonomy.
- Develop a regional recovery plan compatible with the climate emergency, in conjunction with the Regional Prefecture:
 - allocate at least 50% of the total funding of the Regional Recovery Plan to activities favorable to the climate and biodiversity,
 - exclude all financing with harmful impacts on the climate or the environment (such as: airport extensions, the construction of new road infrastructure and any project contributing to overproduction and land artificialization, nuclear power, financing of projects or devices that promote the exploration, production, transport or consumption of fossil fuels, precision agriculture, the development of 5G, first generation agrofuels).
- Launch an Epargne crowdfunding platform, to channel popular savings from residents of each region to businesses in each territory. To be done in conjunction with the Chamber of Commerce and a specialized crowdfunding platform.
- Act to tax at European borders products with social and environmental standards different from ours.
- Stop any creation of medium and large surface areas.

Renewable energies

All energy sources have advantages and disadvantages. It is therefore urgent to stop avoidable uses.

Build and deploy a roadmap aiming for a dominant role for renewable energies in 2050 with a connection of European networks to compensate for intermittency, with a significant place given to local and citizen projects – bringing together communities, residents, farmers, unions and others local actors to achieve the objective of 15% citizen renewable energy in 2030. This ambition will translate into structuring public policies, such as:

- financing of regional citizen energy networks to support projects, information and communication campaigns aimed at residents and communities,
- financial support to encourage the territorial anchoring of projects, studies and for the investment by citizens and local actors,
- the provision of engineering to facilitate territorial cooperation.
- explain that these energies create more jobs than fossil and nuclear energies

As long as we have not reached an optimal level of insulation of inhabited premises, collective and non-polluting transport, omnipresent environmental education and a supreme circular economy, a share of nuclear power will be necessary.

Accommodation

The main reasons for the housing crisis are the inertia of public authorities in the face of those who degrade their housing, the overprotection of voluntary bad payers, the regulation of rents... owning and renting has become a humanitarian action.

The case of student accommodation is symptomatic: a quarter of our retirees have 1 room available. Consequently, if 10% were willing to rent that's nearly 500,000 pieces on the market! But the retiree will only accept a simple formula to terminate the contract.

The squatters even manage to get the wronged owners convicted! Hence 3 million vacant homes in France in addition to 10 million m2 of offices which refuse to be transformed into housing. Despite 40 billion euros of public funds invested each year, the lowest 25% of households (most often tenants) devote a third of their income to their housing expenses. 14% for the wealthiest households.

- Facilitate access to credit to move towards a France of 100% owners.
- Identify all vacant housing and large unused office spaces, to reduce the need for housing construction
- End social housing for life because
 - 1) Adapt social housing to the number of people who live there. The single person will at best occupy a 2-room apartment.
 - 2) Take into account the evolution of the tenant's income
 - 3) Facilitate social apartment exchange depending on workplace
 - 4) Make a standard lease to give the social landlord the possibility of evicting the generator every 3 years without the judicial institution.

- In order to support households experiencing energy poverty, link subsidies granted to landlords to efficient energy renovation (BBC level) of social and private housing.
- Eliminating energy poverty through systematic thermal renovation
- Deploy the Public Service for Energy Performance of Housing (SPPEH) in its territory. Households need clear information on the assistance available and quality human support throughout their efficient energy renovation journey to take action. This local public service must:
 - Being able to benefit all citizens, and particularly the most precarious;
 - Offer personalized and independent information, advice and support,
 - Cover the entire territory and be accessible to everyone,
 - Offer sufficient financing, particularly through regional third-party financing companies, and long-term for individuals.
- The establishment of such a public information and support service for households is estimated at around €3 per inhabitant per year (€200 million per year nationally).
- Building training must take “High Environmental Quality” construction into consideration.
- Promote, facilitate and organize intergenerational cohabitation.
- Facilitate the creation of schoolhouses and the installation of lightweight housing.

Health

Health is the most important subject there is. However, our country practices a disease policy even though it is simple, ethical, ecological and economical to practice a health policy. The figures mentioned come from the Ministry of Health. What is happening in France leads to human disasters but also to a financial disaster, as the Covid crisis has proven.

The vast majority of babies are born healthy, but it should be noted that their bodies already contain synthetic chemicals such as bisphenol A. We also know that episodic illness is part of a health process. Allergies, pimples, difficulty sleeping, lack of energy, pain, nervousness, fatigue, fever, food intolerances, heaviness in the stomach, discomfort, illness, redness, difficulty breathing, cough, tumor, vomiting are part of our internal alert system, the result of millions of years of adaptations and improvements.

The human body is a wonderful survival “machine”. If one kidney has to be removed, the other kidney will enlarge and do the work for two. Lung tissue may “grow back”. The phenomenon of homeostasis is impressive: it is the tendency of living organisms to maintain their biological parameters constant in the face of changes in the external environment. So we are good at harmony! Our existence today is indisputable proof of our basic abilities to live a long life and survive illness. Our lineage has been able to overcome an unimaginable amount of obstacles, whether wars or plagues of all kinds for millions of years... Despite all this, we are here. We are the result of extraordinary selection, including 9 months before our birth, when an egg chose a single sperm from billions of others.

A disease is often multifactorial. So are the solutions.

The famous advertising slogan “too fat, too salty, too sweet” is welcome, but this action is clearly insufficient. The verdict from the Harvard School of Public Health falls like a blow: “It is irresponsible to encourage the consumption of dairy products.” And we can greatly reduce our meat consumption.

We know that Asians, in their traditional living conditions, are almost unaware of cancer, but that when they come to the West, they adopt local behaviors and reach rates comparable to those in the host countries.

Everything will depend on what we decide to put in our mouth, how we use our body, what we choose to hear and see.

Your state of health and your state of aging depend on the state of your cells which depends on the quality of your aerial, environmental, physical, relational nourishment... Many researchers are working on hormones to slow down aging: DHEA, hormones thyroid, estradiol, progesterone, testosterone, pregnenolone, melatonin, cortisol and growth hormone. We are also working on food supplements. But the results are bad. Especially since there is rarely a prior blood test to assess possible deficiencies.

Specialized scientists explain that a low-calorie diet, balanced in nutrient intake, is the best slowdown in aging. Complemented by a calm life, we can then make good old bones.

Some people talk to us about diseases linked to aging populations, but cancer is the leading cause of death before the age of 65. We are told that life expectancy is increasing, but this is debatable.

PREVENTABLE DEATHS AND ILLNESSES

The liver, in addition to its action in digestion, is an organ that plays a crucial role in the body. It is the central laboratory of the body.

Fasting, by putting this primordial organ to rest, by allowing each liver cell to clean itself and eliminate it, gives each of our cells a new lease of life. A fast of a few days is an extraordinary human experience. We will realize, here too, that we can live and be happy with less. He who has fasted knows that the faster is not hungry! (study here (<https://lactualite.com/sante-et-science/jeune-intermittent-que-dit-la-science/>)))

The proximity of the words "young" and "fasting" is a strong symbol

A mono-diet with seasonal organic fruit, for example, is easy to do. It will rest your body. Practicing it 24 hours every fortnight is a good habit.

Intellectual activity (games, reading, analysis exercises, memorization, meditation, etc.), healthy food and water, calm breathing, regular physical exercise, moderate stress are essential to preserve your brain.

Alzheimer's can be rare. The main cause of Alzheimer's disease is not aging, but poor aging.

In 2019 in France, 50% of deaths were caused by cancer and cardiovascular diseases. These two scourges are equal in number of people affected: nearly 900 people die every day between them. However, the majority of specialists recognize that the causes of these diseases largely depend on our good will. A large majority of illnesses and deaths are due to 6 preventable causes: stress, sedentary lifestyle, poor diet in terms of quality and quantity, alcohol, tobacco and polluted environment. Most of the viruses likely to trigger pandemics that cost fortunes have their origin in livestock farming, which should lead us to question the massive place of animal proteins in our diet.

The third cause of death is linked to iatrogenesis (disease caused by medicine): 40,000 victims per year, as well as 500,000 hospitalizations, with the all-too-famous nosocomial infections.

The fourth cause is statistically represented by violent deaths: 7%, 3/4 of which are classified as accidental (suicides, road deaths, crimes, etc.).

The fifth cause is diabetes and Alzheimer's.

If we examine the number of patients, we see that nearly 15 million people have ALD (long-term illness), 5 million regularly take anti-depressants, as many (sometimes the same ones) have sleep disorders, another 5 million suffer significant headaches...

If France is on the world podium in terms of alcohol consumption per inhabitant or tonnes of pesticides per hectare, it is also there for the consumption of medicines (1,500 tablets per year on average per inhabitant)! For information, in the Netherlands, the majority of consultations end without prescription of medication. One problem is that all these drugs end up in our waters through urine. The wastewater treatment plants were not designed to eliminate all the molecules invented by chemistry and pharmacy over the last 50 years. For example, even for aspirin which degrades 90% after water treatment, we still find traces of it.

But we don't drink enough water and its quality is insufficient!

According to the National Health Monitoring Institute (INVS), the French have four times more PCBs and three times more pesticides in their blood than Americans.

Clark Spences Larsen, a specialist in bioarchaeology at Ohio State University in Columbus and member of the Global Health History Project in Europe, denounces a general decline in human health throughout the world. the European continent and around the Mediterranean basin over the last three thousand years.

The multiplication of degenerative diseases is symptomatic.
In short, there are serious problems, and they are avoidable!

THE SITUATION OF HEALTH PROFESSIONALS AND ITS CONSEQUENCES

Meanwhile, medical demographics are declining. We complain about the lack of doctors, the delays in appointments with specialists, while health professionals work more and more: 55 hours per week. The singular dialogue which was the prerogative of the family doctor disappears, the “listeners” are now the only “psychiatrists”.

Additionally, according to the WHO, one in four people will need mental health care in their lifetime. We will see in our proposals how to rehumanize medicine and free it from the accounting domination which is destroying it, like most public services today.

The “Emergencies” are overwhelmed. We want more doctors in rural areas, more hospital beds, more effective medicines, and, depending on the ideology, politicians will reimburse them more or less. The majority of surgical procedures are subject to free fees. More and more French people are giving up treatment due to lack of means...

WE DON'T PREVENT ENOUGH, SO WE CARE

Beyond the human tragedies linked to all these preventable illnesses and deaths, the current global crisis is partly explained by the disease policy led by so-called "developed" countries: 14% of the United States' GDP is lost in “health” spending, 12% in France, 9% in Europe. Much more than any overall financial deficit. Treating is becoming more and more expensive and dangerous, while the solutions are often simple when we choose prevention. This policy will cost France nearly 300 billion euros in 2022 (all local and national education budgets represent less than half of this sum)!

And that's just the direct cost. Poor health causes a lot of suffering and heavy collateral costs, for example poor quality of work or difficult relationships... We know that everything is linked. Making a good economic policy weighed down by such a burden linked to our disease policy is impossible. But a health policy requires a good agricultural policy: organic and GMO-free. It will also be necessary to largely limit our polluting collective actions, the savings will then be significant (for example, it is less expensive to preserve healthy water than to depollute it). If you look at the dashboard of the general

Social Security system, you will notice that the annual deficits are around a few tens of billions of euros, despite colossal inflows of money. And in the overall Social Security budget, 1 in 2 euros goes to "health" while glasses and dental care are poorly reimbursed, for example.

This has an impact on unemployment, since companies are penalized in their recruitment through the contributions they pay. 3/4 of health spending is financed by Social Security, therefore by companies and individuals, and 25% directly by "consumers". All this is financially untenable, constructive action is urgent. The objective is not to reduce reimbursements or provide poor insurance, it is a question of preserving health.

COSTLY CONFLICTS OF INTEREST

After "antibiotics which should no longer be automatic" (2003), the affairs of the H1N1 virus, vaccines and Mediator have helped to enlighten populations about the bad room in which the System has been making us play for too long. We understand more and more the game of the large pharmaceutical laboratories which multiply the tests on each molecule, based on animal experiments, and only present to the authorities those favorable to the future drug. In addition, they promote vaccines without necessity. You will note that, for medications, doctors specify that you should not give the same ones to everyone without their prescription, whereas, for vaccines, we do it all...

Most European populations are not subject to these obligations.

The financial stakes are such that one may worry about the accuracy of the advice of Western medicine. It would be a disaster for very powerful interests like big pharmaceutical companies if people were simply healthy or healed too quickly. We understand why some of their experts work within the WHO.

Act to make organic food prices accessible to all

HEALTH

We believe that 19th century scientist Antoine Béchamp was right about one thing about Pasteur: his microbial theory. The important thing is the terrain, not the microbe. Our immune system is not part of a well-established structure, it is akin to a phenomenal army on permanent alert distributed over a territory: our body. Our health and vitality require proper elimination of waste from the body. We are home to billions of bacteria, mites, viruses and yeasts which constitute the fauna and flora and whose number is 100 times greater than that of our own cells. But, with poor lifestyle, these invisible beings waste away because they are asphyxiated and deprived of their nutrients. They then give way to other less friendly microorganisms. We know that harmless elements then become pathogenic.

This neighborhood fight translates into symptoms of illness. Only circumstances make microbes and viruses pathogenic on weak organisms. As for diseases, they are only symptoms of disturbances in our general state, and so-called "genetic" diseases are expressed mainly from a favorable context.

This is why a health policy is vital. It depends on individual decisions and collective decisions. Everyone is born with a different quality of "car", but life skills will have a large influence on the essentials: health and energy.

If you accept to live in permanent stress, if we continue to choose a productive society, health will become more and more distant. Calm, respect, responsibility and love are the pillars of health.

Everything is connected.

The first master of your health is yourself.

The health policy that we recommend is based on health education, therapeutic education, an organic rather plant-based diet, the practice of physical activity, the choice of a peaceful life, the cessation of animal experimentation and the use of chemicals, respect for the environment, the reduction of electromagnetic pollution, the end of violent noise, the cooperation of health practitioners with doctors, but also the cooperation of all medicines, conventional or not .

Ayurveda, acupuncture, aromatherapy, Chinese medicine, chiropractic, herbalism, homeopathy, hypnosis, magnetism, massages, meditation, naturopathy, phytotherapy, psychotherapy, qigong, reiki, tai chi, yoga... This trend is true in most Western countries since the proportion of non-conventional medical care patients varies from 20 to 50%, or even 65% in Japan. We note that Germany, where the "Heilpraktiker" thrives, has an annual health expenditure per capita that is 20% lower than that of France. This contributes to his current good accounts.

It would be interesting to finally examine closely the work of Beljanski, Buchinger, Dubost, Gernez, Hamer, Kieffer, Kousmine, Marchesseau, Nieper, Nord, Odoul, Quinn, Seignalet, Solomides, Souccar... whether it concerns cancer, multiple sclerosis, or any other ailments...

Personal medicine is much better than mass medicine. The famous "protocols" are enemies of longevity when they are dogmatic. Every human being is unique. We are unequal when it comes to poor nutrition or electromagnetic waves. The protocols are interesting, both for diagnosis and for therapy, but they considerably limit the doctor-patient relationship and the depth of the problem.

The cause of illness is lack of harmony. We can "cure" the disease before it sets in. When disharmony begins to penetrate into us (jealousy, despair, slander, overloads of all kinds), it is already illness that sets in because it is nothing other than a disorder. If harmony is within us, it repels disorder.

Likewise, a policy of active prevention is preferable to a policy of hoped-for cure. But vaccines and screenings are not prevention! Once we detect, it may be too late or... too early! For example, the British doctor Michaël Baum, who participated in the implementation of screening in England, resigned, noting that "the most worrying thing is that organized screening leads to over-diagnoses of breast cancer", this is that is to say that the identification of small nascent tumors gives rise to a diagnosis of cancer requiring treatment, whereas it may be a non-progressive cancer. Here again, the "patient" must be informed.

Our country, its leaders and many of us have long chosen a disease policy.

The best medicine is practiced every day through the way of living, that is to say the way of loving, of eating, of thinking, of working... This is why it is so important that instead of concentrating on illness, we begin to study health and the factors of which it is the result (behavior, nutrition, thinking, breathing, etc.).

The roles of those around you and the environment are not trivial.

We are beginning to realize concretely that the psyche has something to do with illnesses, to finally penetrate the subtle side of the human being.

Yes, medicine is more of an art than a science.

Yes, she still works on beings she knows little about.

Here are our proposals in the areas of education and the general organization of Health:

EDUCATION

- Understand that pedagogy and health education are the first medicines
- Do prevention from a very young age (CM1), with videos on drugs for example. Nutrition classes, organic canteens with a vegetarian day are welcome.
- Promote physical activity for all.
- Rebalance school schedules and calendars to allow young people to have more time for physical activity, but also to make them choose their sport.
- Explain that the quality and quantity of food are decisive in health matters.
- Raise awareness of the damage caused by the consumption of sugar, salt, processed and refined cereals, modified starch, unnecessary additives and colorings, fatty and animal products, industrially prepared dishes and those that are overcooked.
- Explain the financial, environmental, moral and health benefits of reducing meat consumption.
- Maintaining teeth and brushing them are important actions; devitalized teeth are a problem that deserves examination.
- Promote breastfeeding.
- Provide simple and informative labeling on product quality.
- Understand that water quality is an essential element for health and act accordingly.

GENERAL ORGANIZATION

- Modify the system of compulsory company mutual insurance (the member is no longer free to make his or her health choices).
- Denouncing the new medical agreement which binds funds, doctors and patients for 5 years, it adds a shameful performance bonus clause.
- Review fee-for-service remuneration with key letters which has a perverse effect with the increase in procedures, therefore a reduction in the quality of procedures.
- Review the training of doctors in nutrition and psychology in particular.

- Establish a professional corps of health educators trained in prevention for all ages and all locations, in businesses for example.
- Prioritize schools, universities, businesses, retirement homes, hospitals, prisons and rehabilitation centers to teach nutrition and health.
- Contribute to preserving health through local and national actions against chemical, bacterial, auditory, visual and electromagnetic pollution.
- Recognize non-conventional medicine with charter and diploma elements.
- Structuring, organizing and professionalizing unconventional approaches which can be alternative or complementary.
- Remove the legal powers of the Council of the Order.
- Establish therapeutic freedom.
- Apply vaccine freedom as in other European countries.
- Report all pathologies occurring after vaccination and have them examined.
- Act to ensure that neutral public bodies objectively study the effectiveness and complications of vaccines.
- Publicize the results.
- Implement an individualized vaccination policy with complete information for the potential vaccine recipient.
- Organize a declaration by patients themselves of the adverse effects of their medication.
- Clearly inform the French of the risks linked to a screening action (cancer, Alzheimer's, etc.).
- Develop more effective pharmacovigilance in real time.
- Promote biomonitoring.
- Ban the use of dental mercury.
- Recognition of electrohypersensitivity as an environmental pathology.
- Creation of habitable white zones.
- Go from 0.6V/m to 0.2 V/m for indoor microwave exposure level.
- Ban anything that can be replaced by wired (all forms of wireless internet).
- Ban cell phones for children under 15.
- Prohibit the discharge of wastewater into rivers, lakes, seas and oceans without having been treated by a biological filtration process.
- Establish local organic food at all public catering points, as well as a vegetarian option.
- Create a National Plan for Local, Organic and Solidarity Food.
- Eliminate food irradiation and ionization.
- Convert land to organic within 20 years.
- Ban GMOs and nanotechnologies, no moratorium.
- Encourage those who wish to produce and distribute healthy food (therefore organic), accessible to all, and, consequently, to have access to resources (land, water, reproducible seeds, small equipment, housing, etc.).
- Liberalize the distribution of reproducible and organic natural seeds.
- Diversify production, direct sales, organic markets and encourage self-production of food.

- Increase shared gardens and promote permaculture such as biodynamics.
- Act to establish a World Organization for the Protection of Biodiversity.
- Gradually move away from nuclear and fossil fuels through an intelligent energy policy: diversity (renewable energies), efficiency (insulation and savings education), local economy, rurality and sobriety.
- Getting out of chemistry through adequate legislation and active consumer awareness
- Research and then prohibit the use of any products harmful to health for anything offered to the public, whether in their home or any purchasable item.
- Remove glass wool and rock wool from sale.
- Formalize a committee of independent experts on medicines, vaccines, chemicals, suspicious traces in the sky, electromagnetic waves of human origin.

Human health requires animal health

Morals, a sense of responsibility, the heart, water (to make 1 kilo of meat, you need on average 7 kg of cereals, therefore 10,000 liters of fresh water), respect for the environment (we slaughter forests to make pastures), purchasing power (a plant-based food bowl is less expensive than an animal food bowl), require respect for animals:

- Eliminate industrial farming in favor of small farms that respect the needs of animals and promote animal health.
- Include more animal welfare standards in the Label Rouge and regional labels.
- Immediately apply methods replacing animal testing (see the Proanima, Antidote Europe associations and techniques on mitochondria)

Security of goods and people

On this subject again, the fact is that ecology is the solution, any other project, the problem. We resolve the issues of food security, energy security, social security, but also the security of goods and people. How could the conventional parties teach us lessons when the inhabitants of our country have suffered 10,000 crimes and misdemeanors every day for so many years?! Specialists count 500 lawless zones in France! Law enforcement officers attacked, trade unionists attacked, night rodeos, wild bands... 15 laws in 9 years on terrorism... The ecological society largely reduces this serious problem by first identifying the causes: despair, lack of education, lack of activity, feeling of injustice, feeling of impunity, feeling of uselessness, communication defects. Without a known and analyzed cause, the solution cannot be found. Here are the actions to take, there are long, medium and short term solutions:

→ Another education: if the education given to children was more focused on knowing how to be and how to do things like in Montessori or Freinet schools for example, the adults of tomorrow would have more discernment, would be more autonomous, cooperative and peaceful...

→ Another societal system: the society of yesterday and today is focused on competition, consumerism, productivism, having is preferred to being. This is a source of conflict and frustration. Elected officials and administrators must build together a more sober, more cooperative society using tools such as urban agriculture, collective composters, complementary local currencies, grouped housing, local exchange systems, citizen committees. link....

→ Increased protection: increase police presence and vigilance in our streets and neighborhoods: administrative work will be done by secretaries, the police officer will be on the ground. Create as many vigilance brigades as possible from volunteer and trained citizens, whether able-bodied or disabled. Our country has a huge unused pool of people capable of resolving staffing shortages in our fields, in our streets, in our intelligence services, in our hospitals, for single people... 3 million full-time unemployed, in full time normal (excluding Covid) suffer a financial problem and the painful feeling of uselessness. We can mitigate the first mentioned and put an end to the second: from the 4th month of compensation, the income distributed will be in exchange for a part-time activity of general interest. On this security chapter, it will therefore be proposed to access these surveillance brigades, each made up of 2 people recognizable by a colored vest, unarmed, equipped with a telephone to report any problem to the police or gendarmerie, who will crisscross the neighborhoods defined by the appropriate authorities.

→ Effectiveness, firmness and speed of the criminal response: as long as there are as many cases to deal with, increase the number of magistrates and clerks, restore minimum sentences, establish an effective monitoring plan for those leaving prison. Implement very short immediate sentences, a few days or a few weeks: being suddenly deprived of liberty and your cell phone is a memorable sentence for the young offender, it will mark him and thwart the desire to reoffend.

→ The electronic bracelet and the anti-contact bracelet are 2 effective tools that are insufficiently used

→ Terrorism: Those leaving prison for terrorism must wear an electronic bracelet. Heavily condemn those around you if they were informed of the terrorist's disastrous plans. No reduction in sentence. Sanction apologies for terrorism on social networks. Infiltration of suspicious associations. Dissolution so violent and examination of sermons. We do not close a mosque, we sanction the individual who calls for violence! Muslims must organize to denounce Islamist terrorism.

→ Yes there are forgotten territories of the republic, yes there are lawless areas in France, yes the drug trade is a scourge. And here again, there are tens of thousands of people, often disadvantaged, who suffer the actions of a few dozen delinquents. We ecologists, propose the creation of 10 mobile

brigades specialized and trained on these subjects, composed of police officers, gendarmes, tax agents, psychologists and magistrates of the targeted location, to intervene massively and suddenly in these areas, make adequate arrests, pass in immediate appearance of the suspected persons, so that the offenders of these difficult neighborhoods know that at any moment, the State can take its place and they find themselves in prison, far from their area of misdeeds, the next day

→ Any person of foreign nationality sentenced to a prison sentence will be deported to their country

→ Abolition of all visa allocation and development aid for countries which refuse to take back their expelled nationals

Territories

As part of the adaptation of forests to climate change, establish additional diversification criteria for obtaining or improving public subsidies:

→ at least 30% diversification from 2 hectares and one mesh at 2 hectares (i.e. for each slice of 2 ha), obligatory for obtaining,

→ at least 3 species including at least one hardwood species (greater than 70%) and one native species (for an increase of 80% of the aid rate).

→ Adapt our territories to the certain impacts of climate change (rising sea levels, floods, landslides, etc.) by moving, planting shrubs, etc.

→ Create further parks and nature reserves, some of which are free from any intervention human.

Transition

Support the development of animation engineering for ecological transition approaches in communities or project territories to mobilize, raise awareness and support local stakeholders. This support can take the form of (co)financing, training and networking of elected officials and technicians from sub-regional communities.

→ creation of a delegation which will be on the lookout for everything good that is being done in Europe and in the world to apply it in our region

→ widely disseminate an eco-responsible tourist charter which will not be a brake on tourism but on the contrary, a particular attraction since we want to make our region a reference in terms of air quality, water quality, ease and safety of transport, etc.

→ encourage the commitment and initiative of young people in environmental projects

→ promote a lifestyle that reduces pollution.

Raise awareness and train local residents on climate and environmental issues:

- develop initial and continuing training in key sectors of the transition and strengthen information and change in practices favorable to ecological transition,
- define and implement a regional plan of education and awareness of the environment and climate throughout the territory among all audiences, in partnership with local actors specializing in these issues.
- involve all regional and local media for this essential information
- creation of specific operating aid for schools which develop environmental and agricultural education programs. → work with the CROUS on the quality of meals, so that they are fresh, organic and local.
- adaptation of professional and continuing training schemes for professions relating to the environment, manual knowledge and agriculture.
- organize pressure from public opinion on banks which finance anti-climate, anti-healthy environment activities, etc.

Transportation

Facilitate access to sustainable transport:

- Creating a Europe of local transport: thanks to a policy of intelligent works, by creating new autonomous metro lines in failing European regions.
- to move from a transport culture “I am alone in my car” to a transport culture compatible with sustainable well-being, we must accustom children to the bus, the metro, the tram, the train, the bicycle, walking on foot....
- by making stations real multimodal hubs, notably with the development of secure bicycle parking , → by offering an adequate/increasing offer for loading bicycles on regional trains and coaches, → by proposing solidarity pricing for rail transport. → establishment of incentive and supportive policies for shared cars which are an exceptional tool for social bonding, savings and less pollution → quarterly evaluation of the level of satisfaction of public transport users. → multiply non-fossil fuel minibuses because the train cannot go everywhere

- Commit to maintaining all current train lines, in particular “small lines”, and develop the rail offer, in particular metropolitan express services to better connect large cities to the rest of the territory.
- No longer grant public subsidies and oppose airport expansion projects, commit to investing the equivalent amount saved in and for activities favorable to the just and ecological transition.
- each train stop will correspond to the arrival and departure of buses and other means of transport (bicycle parking, carpool parking)
- Simplify the use of all public transport (excluding TGV and plane) with a national transport/pass valid for 1 year at a monthly price of 50 euros.

Free public transport is neither a brilliant idea nor absolute evil. But Ecology at the center is unfavorable because

- a) the free payment for the user becomes the taxpayer's payment
- b) This creates additional taxation for households and/or businesses
- c) The payment, even symbolic, implies an active process of membership
- d) Tourist areas can be even more invaded
- e) Failure to pay for a good or service can create a culture of disempowerment and rights without duties
- f) The service is less degraded when it is paid
- g) It costs less in maintenance
- h) Free implies use for a few meters (for example, going to the desired destination which is 1 station from the boarding point)
- i) The modal shift is low while the cost reduces the financial margin to develop and improve the offer
- J) Public transport is already much cheaper than the car
- K) Free transport can reduce the use of other soft transport
- L) The need to increase the collective transport reflex instead of individual transport requires school habits, good timing, punctuality, certainty of passage, security and active and gentle commercial canvassing, to sell annual multi-public transport subscriptions to tourists upon their arrival or reservation, as well as to inhabitants of the territory.

A win-win partnership with Africa

We have an environmental and financial responsibility linked to our past and present economic and societal choices. We believe that public aid benefits from being focused on agriculture, educating couples about childbirth, and supporting the restructuring of local governance when the population concerned requests it.

Put an end to the predation of large industrial groups where the French State is present or aided by the public authorities of our country. Act so that the European Union coordinates its aid by prioritizing the prosperity of African agriculture.

Examine the coherence of international public policies with the objectives of official development assistance (ODA) in the poorest countries. Break with the vertical vision of North-South relations. Support engaged citizens and local expertise, and in particular feminist movements, through a dedicated fund.

Stop at European and global level free trade agreements and the dumping of subsidized agricultural production which are destroying the most vulnerable farmers in the world. Support their transition towards effective agroecology which will feed populations and preserve global public goods. Contribute to the energy autonomy of territories.
